Are you a parent of a young child?

Do you want to learn about your child’s development?

Are you interested in a free online evaluation of your child’s skills and abilities?

Developmental Psychologists at Case Western Reserve University are interested in studying children’s attention, language and emotional issues. Children should be between 12 months to 7 years of age. The study will include three parts:

1. A fully online questionnaire
2. A child assessment session
3. An optional intervention of five sessions will likely take place at a later date.

Why Participate?

As parents you will benefit from:
- An understanding of your child’s development.
- Learning about your child’s skills and abilities.
- Our online assessment will provide you with insight into your child’s cognitive, linguistic, and play skills.
- Our intervention may provide you with effective tools for interacting with your child.

Reimbursements:

- In Phase 1, Parents will receive feedback on their child’s strengths and weaknesses, to date.
- In Phase 2, children will receive small toys as a gift for participating and parents will receive a brief summary of their child’s cognitive, linguistic, and play skills.
- In Phase 3 (late spring), parents who enroll in the intervention, will receive a developmentally appropriate workbook outlining strategies designed to optimize child development.
